

Restore from System Backup

To restore backup:

1. Download the backup file from FTP server to master server and extract the zip file.
2. It will have two files:

```
# database_name.gz  
# solusvm.conf
```

3. Extract the database file like:

```
# gunzip database_name.gz
```

4. Restore database using the command below as an example:

```
# MYSQL_PWD=$(cat /usr/local/solusvm/includes  
/solusvm.conf \  
| awk -F ":" '{print $3}' ) mysql $(cat /usr  
/local/solusvm/includes/solusvm.conf \  
| awk -F ":" '{print $1}' ) -u$(cat /usr/local  
/solusvm/includes/solusvm.conf \  
| awk -F ":" '{print $2}' ) < database_name
```

Note: replace `database_name` with the actual name. Also, you can fetch the required information about database connection manually from `/usr/local/solusvm/includes/solusvm.conf` file, see [About solusvm.conf file on Master Node](#)
