

Information before installation

- SolusVM Master **must** be installed on a clean server: freshly installed server updated to the latest version with `yum update`
- SolusVM Master supports OpenVZ virtualization only. Xen and KVM can be run only on SolusVM Slave.
- SolusVM Slave **can** be installed on a server with VPSes running on it already and it will be possible to import them to SolusVM, see [Information before installation](#)
- SolusVM Slave **must not** be installed on a server with the similar software like Virtualizor.
- Documentation is focused on using **RHEL7**-based operation systems, so there can be slight difference for older operating systems.
