

# Adding OpenVZ EZ templates

1. Access OpenVZ 7 node via SSH and install required template with the command:

## Install required template

```
yum install centos-7-x86_64-ez
```

The template name always has the structure **{distribution}-{release}-{arch}-ez**. As an example `centos-7-x86_64-ez`

2. Access the master node via SSH and create a file under `/vz/template/cache` directory.

The file name should be a template name with `tar.gz` extension. In our example the name would be `centos-7-x86_64-ez.tar.gz`:

## Create a file

```
touch /vz/template/cache/centos-7-x86_64-ez.tar.gz
```

After that just follow the usual [instruction for registering templates](#).
