

Importing KVM virtual server

To import a KVM virtual server from the administration panel do the following:

1. Select **Virtual Servers > Add Virtual Server**
2. Select **KVM**
3. Select the **Node & Plan**, then click **Continue**
4. Enter the KVM ID of the virtual server you want to import in the KVM ID field
5. Fill in the rest of the fields
6. Click the **Create Virtual Server** button
7. Add any extras ip's etc.. to the virtual server
8. Click the reboot button to reboot the vps and rewrite the configuration files

If you are importing from another panel or using custom named logical volumes you will need to rename the logical volume to match the SolusVM format. The logical volumes are displayed in the creation success message.

Example:

```
SolusVM format:  
/dev/LOGICAL_VOLUME_NAME/kvmID_img
```

```
Example:  
/dev/vps/kvm101_img
```
